

Know when the reasoning behind a decision starts to fail.

Every decision rests on a few assumptions about customers, capacity, timing, or the market. Decision Vitals records them, weighs new evidence against them, and shows you which still hold.

[Record a decision](#)[Load sample decisions](#)

The samples include finished reviews, the fastest way to see a decision-health report.

How it works

01

Record a decision

Describe a decision you've made. Decision Vitals identifies the assumptions it depends on and marks which ones are critical.

02

Log evidence

Paste what you learn as it lands: meeting notes, support tickets, customer feedback, market updates.

03

Review the decision

Specialized AI agents weigh the evidence for and against each assumption, then combine their findings into one dated decision-health assessment.

Record a decision

Describe a decision you've already made. Decision Vitals identifies the 3 to 5 assumptions it depends on and marks which ones are critical. You log evidence and review the decision on the next screen.

Demo Mode replays recorded reviews of the sample decisions, so it can't analyze a new decision. Switch to Live Mode (header toggle) to record your own.

Decision statement

e.g. Migrate our B2B product from per-seat pricing to usage-based billing in Q4.

Context (optional)

What prompted it, constraints, stakeholders.

Owner (optional)

e.g. Casey Rivera

Date (optional)

Expand café to downtown business district

● Not yet reviewed

Open a second café location in the downtown business district this fall.

Context: Our single shop is at capacity on weekday mornings; a downtown storefront just opened up with three months of free rent; the owner wants to grow before a competitor takes the spot.

Recorded Jul 1, 2026

Assumptions are what this decision depends on; **evidence** is what you've learned since. Log at least one piece of evidence, then review the decision to weigh each assumption against it.

Assumptions

4 total

A1 **Critical** ● Not checked yet [Edit](#) [Delete](#)

Downtown foot traffic will support sales close to what our current location does.

▲ **Warning signal:** Weekday foot-traffic counts, or early sales at the new site, coming in well below the current shop

A2 **Critical** ● Not checked yet [Edit](#) [Delete](#)

The business has adequate staffing, supply chain capacity, and operational systems to manage two locations simultaneously without degrading service quality.

▲ **Warning signal:** Customer complaints about wait times or order errors increase at the original location; staff turnover accelerates; supplier delivery delays or stockouts occur; order-to-service time exceeds historical averages at either location.

A3 **Supporting** ● Not checked yet [Edit](#) [Delete](#)

The new location will not pull a large share of sales away from our existing shop.

▲ **Warning signal:** Existing-store sales dropping once the downtown location opens.

A4 **Supporting** ● Not checked yet [Edit](#) [Delete](#)

The build-out will be finished before the three months of free rent run out.

▲ **Warning signal:** The contractor timeline slipping past the free-rent window.

Decision Health Report · Review #1 · Jul 29, 2026

Open a second café location in the downtown business district this fall.

● At Risk

The decision to open a downtown café this fall is at risk because the critical assumption that current operations can support two locations is invalidated: hiring takes about six weeks and a recent new hire quit within a month, meaning the business is already short-staffed before adding a second site. A second critical assumption, that downtown foot traffic will translate into comparable sales, is unproven, resting only on raw pedestrian counts with no conversion, competition, or occupancy data. Cannibalization of the existing shop is also already signaled by customer intent data, compounding the operational risk.

Where each assumption stands

Each assessment includes the evidence behind it.

A1

● Needs review

Critical

Downtown foot traffic will support sales close to what our current location does.

The only supporting evidence measures raw pedestrian volume, not paying customers. Downtown office traffic is concentrated in narrow rush windows, collapses on evenings/weekends, and may face denser coffee competition, none of which has been measured.

“about 40 percent more weekday foot traffic than the street our current café”

Market update · Jun 15, 2026

A2

● Invalidated

Critical

The business has adequate staffing, supply chain capacity, and operational systems to manage two locations simultaneously without degrading service quality.

The business cannot currently staff its one existing location reliably, undermining any claim that it has the systems to run two locations without service degradation.

“took about six weeks to fill”

Status update · Jun 18, 2026

“one of those new hires left within a month”

Status update · Jun 18, 2026

A3

● Weakened

Supporting

The new location will not pull a large share of sales away from our existing shop.

A third of existing regulars say they'll switch to the downtown location, indicating substantial revenue cannibalization rather than purely incremental demand.

“roughly a third of them work downtown and say they would visit”

Customer feedback · Jun 21, 2026

A4

● Holding

Supporting

The build-out will be finished before the three months of free rent run out.

Contractor confirms a two-week buffer before free rent expires, but self-reported estimates and thin margins leave no room for ordinary permitting or supply delays, and no contingency plan exists.

“on track to finish about two weeks before the free-rent period ends”

Status update · Jun 24, 2026

The case against

The strongest challenge to each assumption, including the ones that still hold.

Foot-traffic volume is being treated as a revenue proxy with no data on conversion rate, competitive density, or office occupancy volatility in the downtown corridor.

Existing hiring and turnover bottlenecks suggest the business would need to pull trained staff from its current shop to open a second location, degrading service at the original site.

One-third of regulars intending to switch downtown means the assumption of minimal cannibalization should be treated as already contradicted, not merely at risk.

A two-week rent-free buffer offers no real protection against ordinary commercial construction variance, and no fallback plan exists if it's consumed.

Next actions

Strengthen (make the assumption more likely to hold)

Marketing lead to run a 2-week downtown pop-up or partner kiosk test measuring actual transactions per 100 pedestrians, not just foot-traffic counts, before signing the lease.

Protects A1: Downtown foot traffic will support sales close to what our current location does.

Owner to obtain a written contingency schedule from the contractor (permit status, inspection dates, equipment lead times) and negotiate a two-week rent-extension option with the landlord as insurance against delay.

Protects A4: The build-out will be finished before the three months of free rent run out.

Prepare a fallback (in case it turns out wrong)

Store manager to finalize and document a staffing plan, hire and fully train at least 2 additional baristas plus a backup shift lead, before committing to an opening date.

Protects A2: The business has adequate staffing, supply chain capacity, and operational systems to manage two locations simultaneously without degrading service quality.

Ops manager to set up unique promo codes or loyalty tracking at both locations to measure real customer migration in the first 60 days, with a pre-set staffing/hours adjustment trigger at the original shop if migration exceeds 20%.

Protects A3: The new location will not pull a large share of sales away from our existing shop.

Decision Vitals

Vital signs for the decisions you've already made. Decision Vitals watches the assumptions a business decision rests on and tells you when the evidence starts to turn against one.

The problem

Most decisions get made once and are rarely revisited. The assumptions underneath them, about customers, capacity, timing, and the market, quietly go out of date, and nobody notices until the damage shows up in the numbers. Most teams monitor their decisions by gut feel: the review happens after the failure, not before it.

The idea

Every decision rests on a few assumptions. Some are **critical**: if they turn out to be wrong, the decision could seriously weaken or break. Others are **supporting**: they still matter, but the decision can probably survive if they change. For each one there is a **warning signal**, the specific thing you should watch for that would show the assumption may no longer be true. This way of pressure-testing a plan comes from a decades-old risk-planning method (credited below); the bet here is that AI agents make it light enough to actually use on everyday decisions.

What it does

You record a decision and Decision Vitals identifies the assumptions underneath it, marks which are critical, and gives each a warning signal to watch. You log evidence as it accumulates: meeting notes, tickets, customer feedback, market updates. When you review the decision, specialized AI agents examine the evidence from different perspectives and combine their findings into a Decision Health Report: an overall grade, an assessment of each assumption with its supporting evidence, the strongest case against it, and recommended next steps. Reviews are numbered and dated, so a decision builds up a health history instead of a single one-time assessment.

How reviews work

Each review is carried out by six specialized AI agents, each with a single job: two identify and classify the assumptions when you record a decision, and four run the review. Different agents examine the evidence, make the case against each assumption, assess where each one stands, and write the report. Splitting the work this way keeps every step focused, and it means no single perspective dominates: the agent arguing against an assumption has no say in the final grade.

Every step's findings stay attached to the result, so each conclusion can be traced back to the evidence and reasoning behind it. A few fixed rules keep the results consistent: a critical assumption with strong evidence against it can never be marked as still holding, and the overall health grade is computed from the individual assessments.

Decision Vitals also connects to Claude directly: from a conversation, Claude can list your decisions, inspect their assumptions, and log new evidence, which shows up in the app ready for the next review.

Product decisions

Paste-only evidence	No integrations, no file parsing. Adoption beats automation for a tool like this: if logging a piece of evidence takes more than a paste, it doesn't happen.
You edit the assumptions	Before the first review you can reword, rerank, or delete any assumption, so human judgment goes in before the machine's, not after.
Numbered reviews, not silent monitoring	Each review is an explicit, dated event with an evidence record that doesn't change after the fact. That's the honest, lightweight version of "always watching."
Demo mode	The public site replays real recorded reviews, labeled as such, so anyone can try it at no cost; live reviews are passphrase-protected.

Limitations

Results are only as good as the evidence you log, and sources aren't weighted, a rumor and an audited number count the same. It works on one decision at a time, with no links between related decisions. And the model's read on how strongly a piece of evidence cuts is a judgment call, the built-in rules limit the worst mistakes but don't remove them.

What's next

Pulling evidence automatically from one source (a project tool is the natural first one), linking related decisions so a broken assumption in one flags the others, and alerting the owner the moment a warning signal shows up rather than waiting for a manual review.

Built with Claude Code on the web; agents hosted on Claude Managed Agents; deployed on Vercel. Inspired by [Assumption-Based Planning \(RAND\)](#).
